CodeFull | Content organization

Early information architecture • A proposed model for curriculum, lessons, exercises, and challenge content

Learning track

Track: Python foundations (candidate MVP)

Audience: beginner → intermediate

Outcome: build and explain small programs

Version: reviewed curriculum release

Course

Course: outcome and prerequisites

Modules: sequenced topics

Estimated effort: transparent and editable

Completion: clear criteria, not a marketing claim

Module → lesson

One learning objective per lesson.

Authored formats: text, accessible video, transcript-backed audio, interactive activity.

Progress and resume state follow the learner.

Practice content

Exercise: objective, starter code, examples, hints, verified tests, limits, and expected learning.

Challenge: tier, language, open/close state, scoring and privacy rules.

Required metadata for each published learning item

- Stable content ID
- Owner / reviewer
- Version / status
- Learning objective
- Tier / prerequisites
- Accessibility assets
- License / attribution
- Exercise review status
- Change history

Quality and publication gates

Draft → subject review → technical and accessibility QA → licensing check → publication approval → learner feedback → scheduled review. Challenge answer keys and hidden judging material remain restricted; public content exports must never include them.

Status: planning concept, not an approved curriculum or existing content inventory. The source readiness materials identify content ownership, licensing, reviewer capacity, and the authoring pipeline as unresolved. Assign accountable owners before committing a course volume or release date.

This artifact organizes content at a high level. It does not contain lesson text, challenge solutions, or executable judging material.
