CodeFull | Learning flow map

Early concept artifact • Proposed learner journey from first visit through continued practice

1 · Choose a goal

Create an account, choose experience level, goals, languages, and weekly study time.

2 · Find a path

Review a recommended course, tier, module, and lesson. Learner can browse alternatives.

3 · Learn

Study authored text, video, audio, or interactive material. Save progress and resume.

4 · Practice

Try an exercise in the proposed playground. Receive a bounded result and useful feedback.

5 · Reflect

Review learning progress and achievements; ask the tutor or community for help.

6 · Continue / share

Choose the next lesson or challenge. Public profile and recruiter visibility remain opt-in.

Feedback and recovery loops

If stuck:
Offer a hint → a clearly separated AI explanation → optional community question. Never expose a discreet question to public search or feeds.

If a run fails:
Explain the result, preserve the learner's work, allow another attempt within policy, and avoid revealing hidden challenge tests.

If the learner returns:
Restore the last authorized progress position and show a useful next action without implying that points or rank are guaranteed.

Status and safety: concept only. The supplied HTML has sample content and simulated code output. This flow does not imply a deployed learning service, AI tutor, identity system, or safe code-execution environment. Validate with learners and accessibility review before baselining.
